

# Additive Manufacturing: Tools, Materials and Methods

Programme course

6 credits

Additiv tillverkning: verktyg, material och metoder

TFYA88

Valid from: 2019 Spring semester

**Determined by** Board of Studies for Electrical Engineering, Physics and Mathematics

**Date determined** 2018-08-31

## Main field of study

Applied Physics, Physics

**Course level** 

Second cycle

## Advancement level

A1X

## Course offered for

- Master's Programme in Biomedical Engineering
- Master's Programme in Physics and Nanoscience
- Master's Programme in Mechanical Engineering
- Master's Programme in Materials Science and Nanotechnology
- Design and Product Development, M Sc in Engineering
- Energy-Environment-Management M Sc in Engineering
- Biomedical Engineering, M Sc in Engineering
- Mechanical Engineering, M Sc in Engineering
- Applied Physics and Electrical Engineering International, M Sc in Engineering
- Applied Physics and Electrical Engineering, M Sc in Engineering

## Specific information

The course is cancelled fall 2019.

## Prerequisites

Thermodynamics at the level provided in a basic course in chemistry, physics, or materials science. Familiarity with material physics, as provided in a course such as modern physics, is beneficial but not required, as is familiarity with at least one CAD program. (CAD instruction will be offered as a brief supplemental course for those who lack training/experience.) Basic laboratory skills. This will be a relatively fast-paced course. Students who are unfamiliar with at least one of the pre-requisites (physics/chemistry/materials science or CAD) may struggle.

## Intended learning outcomes

This course will provide a general understanding of additive manufacturing (3D-printing), and detailed understanding of:

- the physics and chemistry involved with the various printing methods, including the material requirements,
- the types of materials appropriate for various printing methods,
- various printing methods, their advantages and disadvantages,
- current and future applications of additive manufacturing.

After completing this course, students will be able to:

- describe several types of 3D printers, their mode of operation, and their strengths and limitations,
- determine which type of printer is most suitable for fabricating a part based on the requirements of the desired product (choice of material, tolerances, etc.), or whether 3D printing is at all a viable option,
- prepare 3D CAD models for creating printed devices (including editing for printer limitations, etc.), and
- confidently produce 3D-printed devices with at least two kinds of 3D printers (after hands-on work in the labs).

#### Course content

Material properties in the solid, liquid, and other (gel, glass) states. Phase-change processes and chemical reactions, including photo-initiated chemistry. Introduction to digital control of mechanical systems (stepper motors, etc.) Introduction to fluid mechanics, as applied to additive manufacturing. Introduction to surface science, as applied to additive manufacturing. Applications, strengths, and weaknesses of various forms of additive manufacturing including: Mechanical applications (prototypes, mechanical components), chemical and life-science applications (prosthetics, artificial organs, lab-on-a-chip devices, etc.). An introduction to 3D CAD. An introduction to planning/slicing software. Hands-on design, fabrication, and evaluation of fabricated parts.

#### Teaching and working methods

This course includes lectures, hands-on labs, a student-defined project and a field trip.

### Examination

LAB1	Laboratory work	1 credits	U, G
TEN1	Written examination	3 credits	U, 3, 4, 5
PRA2	Student project and presentation	2 credits	U, G

**Grades** Four-grade scale, LiU, U, 3, 4, 5

Department Institutionen för fysik, kemi och biologi

## Director of Studies or equivalent

Magnus Boman

Examiner Nathaniel D Robinson

### **Education components**

Preliminary scheduled hours: 40 h Recommended self-study hours: 120 h

## **Course literature**
