

## Vibration Analysis of Structures

Strukturdynamik  
6 credits

Contract course

TUU010

Valid from: 2024 Autumn semester

<b>Determined by</b>	<b>Main field of study</b>	
Board of Studies for Mechanical Engineering and Design	Mechanical Engineering	
<b>Date determined</b>	<b>Course level</b>	<b>Progressive specialisation</b>
2024-09-27	Second cycle	AXX

Institutionen för ekonomisk och industriell utveckling		

## Intended learning outcomes

The objective of the course is to familiarize the student with fundamental laws in mechanics of vibration, and to give the student the proficiency needed to independently apply these laws to vibration problems. After completed the course, the student is able to:

- model simple and more complex mechanical systems;
- understand definitions and fundamental concepts used in mechanics of vibrations, e.g. velocity, acceleration, energy, frequency, period and damping factor;
- use modal analysis, solve eigenvalue problems and determine frequencies and eigenmodes for different structural elements;
- use Lagrange's equations to derive the governing equations for a vibrating system;
- solve the governing equations analytically and numerically;
- perform simpler analyses for stability of non-linear systems;
- derive simpler theorems used within mechanics of vibration.

## Course content

Modelling of vibrating systems. Derivation of the governing equations using Newton's laws and Lagrange's equations for linear systems. Systems with one or multiple degrees of freedom. Analytical solution of free and damped oscillations including harmonic and general forcing. Methods for determining eigenfrequencies. Modal analysis. Discrete and continuous systems. Approximation methods and finite elements.

## Teaching and working methods

The teaching comprises lectures, tutorials and computer laborations.

## Examination

UPG2	Hand-in exercises	6 credits	U, 3, 4, 5
------	-------------------	-----------	------------

## Grades

Four-grade scale, LiU, U, 3, 4, 5
